

Creeks & Ponds

The **bullfrog** is an **AMPHIBIAN**, which means it starts its life underwater breathing with gills, then it transforms as it grows so that it can breathe air with lungs and live on land instead.

*Cut out the different stages of the bullfrog's lifecycle, color them in then paste them in a circle on the numbers around the lily pad to show how it transforms from a **tadpole** to a **frog**!*

Life Cycle of a Frog
